In my main(issues).py, I took my code from main.py and altered it to reflect poor development practices like the use of cluttered and uninformative comments, lack of separation into clear and concise functions, avoidance of DRY principles using repeated code and definitions, hardcoded values where a variable would be more concise, unnecessary returns for validation and lack of implementation for object boolean variables.

However, in my main.py I strived to include descriptive comments to organize and label the important parts of my code and what they do. I also strove to implement DRY development principles to reduce repetitiveness and increase readability. I implemented functions to create a separation of concerns which helped me write clean code that was organized by its purpose. For the sake of brevity and simplicity, I used some list comprehension in an attempt to implement the principles of KISS.
